

THINK10

Consultant Dashboard

Functional, UX, backend and quality-control requirements

Prepared for	Think10 Founding and Development Team
Primary audience	Product managers, UI/UX designers, backend developers, frontend developers, QA engineers and operations teams
Version	1.1 - Developer-ready functional specification with visual workflows
Date	15 July 2026

Purpose: define what must be built, how users navigate it, what the system does in the background, how every lifecycle flows from one screen to the next, and how success will be measured.

Decision taken for Version 1.1

The consultant dashboard will use no more than eight top-level navigation items. Complex functions such as quality, reports and marketing will appear as tabs inside those sections rather than separate menus.

1. Dashboard purpose

The Consultant Dashboard enables a verified advisor to manage availability, accept and deliver consultations, review customer context, approve AI-generated reports, monitor earnings, maintain credentials and understand quality performance without leaving Think10.

- Make upcoming work immediately visible.
- Reduce consultant no-shows and preparation time.
- Keep all customer contact, calls, files and reports inside Think10.
- Protect customers through verification, monitoring and quality controls.
- Make payment status and performance expectations transparent.

2. Primary consultant roles

Role	Access level	Notes
Applicant	Application, document upload, status tracking and help only.	Cannot appear publicly or receive bookings.
Approved Consultant	Full consultation, profile, calendar, report and payout functions.	Default working role.
Premium / Featured Consultant	Approved Consultant functions plus eligible marketing tools.	Promotion does not override quality ranking.
Suspended Consultant	Read-only access to notices, completed records, payout status and appeal.	Cannot receive new bookings.

3. Recommended navigation

Order	Top-level menu	Main pages inside	Result / next impact
1	Home	Today, upcoming sessions, tasks, alerts, earnings snapshot	Consultant understands priorities in under 10 seconds.
2	Bookings	Calendar, requests, upcoming, completed, cancellations	Consultant accepts or manages work.
3	Consultations	Customer brief, secure call room, notes, reports, action plans	Consultation is delivered and documented.
4	Clients	Permitted customer summaries, history and follow-ups	Consultant prepares without seeing restricted personal data.
5	Performance	Ratings, quality score, attendance, reviews, warnings, learning	Consultant understands how to improve.
6	Earnings	Revenue, commission, payout schedule, statements, bank status	Consultant tracks money clearly.

Order	Top-level menu	Main pages inside	Result / next impact
7	Profile	Public profile, expertise, portfolio, documents, availability defaults	Consultant remains eligible and discoverable.
8	Help & Settings	Support, policies, security, notifications, language	Consultant receives support and controls preferences.

3A. Visual flowcharts and developer navigation framework

This section is the visual build map. Developers should implement the screens, records, status changes and permissions in the order shown. Each diagram is followed by a workflow matrix that can be converted directly into user stories, APIs, database states and QA test cases.

How to read the diagrams: teal = stakeholder action or main screen; navy/light blue = Think10 system process; amber = review or decision; red = exception, restriction or risk; green = successful result. Diamonds are decision points and arrows show the next system state.

Flow index

Flow	What the development team should understand
3A.1 Consultant navigation framework	Shows how an approved consultant reaches each major function without facing a crowded interface.
3A.2 Application and approval flow	Defines the complete consultant onboarding path, including validation, correction, approval and publication.
3A.3 Booking-to-payout lifecycle	Connects booking, preparation, consultation delivery, report approval, quality control and payment.
3A.4 Quality and enforcement flow	Clarifies that AI can identify and react to risk, while permanent disciplinary decisions require authorised human review.

Development rule: every arrow must correspond to a valid status transition, permission check, backend event and testable next screen.

3A.1 Consultant navigation framework

Shows how an approved consultant reaches each major function without facing a crowded interface.

3A.1 Consultant navigation framework - developer workflow matrix

Use this matrix to build user stories, API events, database states, notifications and QA test cases for the flow shown on the previous page.

Step	Actor	Screen / trigger	User or admin action	Backend / status impact	Next destination
1	Consultant	Sign in	Enter credentials and MFA code.	Authenticate and load consultant role/account state.	Correct dashboard state
2	System	Account-state router	Determine Applicant, Approved or Suspended status.	Apply role and record-level permissions.	Applicant, Home or Restricted view
3	Consultant	Home	Review next session, tasks, alerts and summary cards.	Aggregate live booking, report, quality and payout data.	Open one priority item
4	Consultant	Top-level menu	Choose Bookings, Consultations, Clients, Performance, Earnings, Profile or Help.	Load only permitted records for the selected module.	Module landing page
5	Consultant	Contextual action	Join, approve report, resolve warning or update details.	Validate eligibility, create audit event and update record.	Confirmation or next task

QA requirement: test the normal path, every decision branch, permission denial, notification, audit event and retry/error path shown in the diagram.

3A.2 Application and approval flow

Defines the complete consultant onboarding path, including validation, correction, approval and publication.

3A.2 Application and approval flow - developer workflow matrix

Use this matrix to build user stories, API events, database states, notifications and QA test cases for the flow shown on the previous page.

Step	Actor	Screen / trigger	User or admin action	Backend / status impact	Next destination
1	Applicant	Registration	Create account and verify contact details.	Create consultant_applicant and onboarding checklist.	Application dashboard
2	Applicant	Application sections	Enter identity, expertise, experience, portfolio, documents and bank details.	Save versioned draft; validate fields and files.	Progress updated
3	System	Submission validation	Check mandatory fields, consent, file formats and expiry dates.	Return field-level errors or lock submitted version.	Draft or Under Review
4	Reviewer	Verification review	Assess evidence and claims.	Create review_case with evidence checks.	Decision panel
5	Reviewer	Decision	Request changes, reject or approve.	Set status; send reason/task; write audit event.	Applicant task or approved profile
6	Consultant	Profile setup	Complete public profile and availability.	Run final completeness and category checks.	Active and bookable

QA requirement: test the normal path, every decision branch, permission denial, notification, audit event and retry/error path shown in the diagram.

3A.3 Booking-to-payout lifecycle

Connects booking, preparation, consultation delivery, report approval, quality control and payment.

3A.3 Booking-to-payout lifecycle - developer workflow matrix

Use this matrix to build user stories, API events, database states, notifications and QA test cases for the flow shown on the previous page.

Step	Actor	Screen / trigger	User or admin action	Backend / status impact	Next destination
1	System	Booking event	Confirm slot and lock credit/payment.	Create booking, reminders and calendar event.	Booking confirmed
2	Consultant	Customer brief	Review permitted context and declare conflicts.	Log access and conflict declaration.	Prepared status
3	System	Pre-call readiness	Send reminders and validate consent/device state.	Create readiness events and exceptions.	Join window
4	Consultant + Customer	Secure call room	Attend and complete consultation.	Capture attendance, recording, transcript and session events.	Post-call processing
5	AI + Consultant	Report workspace	Generate draft; consultant reviews and approves.	Version report and store action items.	Customer report released
6	Customer + QC	Survey / QC	Rate service; review flags and SLA.	Update quality score and successful-session status.	Payout eligible or case opened
7	Finance	Payout batch	Approve earnings in 15-day cycle.	Reconcile and issue statement/transfer.	Paid / failed / held

QA requirement: test the normal path, every decision branch, permission denial, notification, audit event and retry/error path shown in the diagram.

3A.4 Quality and enforcement flow

Clarifies that AI can identify and react to risk, while permanent disciplinary decisions require authorised human review.

3A.4 Quality and enforcement flow - developer workflow matrix

Use this matrix to build user stories, API events, database states, notifications and QA test cases for the flow shown on the previous page.

Step	Actor	Screen / trigger	User or admin action	Backend / status impact	Next destination
1	AI/System	Call/report monitoring	Evaluate language, behaviour, attendance, complaints and output quality.	Create signal with confidence and severity.	No issue or QC flag
2	System	Severity routing	Classify low, medium or critical risk.	Apply allowed temporary safeguard and create case.	Coaching, restriction or urgent review
3	QC Team	Case review	Inspect evidence and obtain context from both parties.	Maintain evidence log and SLA.	Outcome decision
4	Authorised Admin	Decision	Clear, warn, train, place on probation, suspend or remove.	Update account state with reason/effective date.	Notification and monitoring
5	Consultant	Appeal	Submit appeal and evidence where permitted.	Create independent appeal workflow.	Final documented decision

QA requirement: test the normal path, every decision branch, permission denial, notification, audit event and retry/error path shown in the diagram.

4. Home screen layout

Area	What the consultant sees	Primary action
Header	Greeting, current status, notifications, help and profile menu.	Open alert or support.
Next consultation card	Customer first name, topic, start time, preparation status and countdown.	Open customer brief / join call.
Today summary	Sessions today, pending reports, unread messages and outstanding actions.	Open the item requiring attention.
Calendar strip	Next seven days with booked and available time.	Edit availability.
Performance snapshot	Quality score, attendance, rating and current account status.	View performance detail.
Earnings snapshot	Current period earned, pending payout and next payout date.	View statement.
Alerts	Document expiry, profile completeness, warning, payment or technical issue.	Resolve the stated issue.

5. Main consultant journeys

Journey A - Application and approval

Step	User action	System response	Next screen / impact
1	Create consultant account and verify email/phone.	Creates Applicant record and onboarding checklist.	Application dashboard.
2	Complete identity, experience, expertise and payment sections.	Validates required fields and document formats.	Progress increases.

Step	User action	System response	Next screen / impact
3	Submit application.	Locks submitted version and creates review case.	Status: Under Review.
4	Think10 requests correction or additional evidence if needed.	Sends task with deadline and comments.	Applicant edits only requested sections.
5	Think10 approves application.	Creates public profile, quality baseline and consultant permissions.	Profile setup and availability.
6	Consultant publishes profile and opens availability.	Profile becomes eligible for matching after final checks.	Home dashboard.

Journey B - Delivering a consultation

Step	User action	System response	Next screen / impact
1	Receive booking notification.	Creates booking, calendar block and reminder schedule.	Booking detail.
2	Review customer brief and uploaded files.	Shows only permitted information and logs access.	Preparation checklist.
3	Join secure call room.	Checks consent, microphone, camera and connection.	Live consultation workspace.
4	Conduct consultation and add notes.	Records/transcribes if consented; AI identifies topics and actions.	End-call confirmation.
5	Review AI-generated summary and action plan.	Creates draft report with flagged uncertain items.	Report editor.
6	Approve and submit report.	Sends customer notification and starts quality review.	Completed consultation.
7	Receive rating and QC result.	Updates quality metrics and earnings eligibility.	Performance / earnings.

6. Functional modules

6.1. Onboarding, verification and approval

Objective | MVP

Collect enough evidence to verify identity, professional credibility, expertise and payout eligibility while showing the applicant exactly what remains incomplete.

User-facing screens and controls

- Progress bar with sections: Personal details, Identity, Expertise, Experience, Education, Portfolio, Availability, Bank details, Agreements.
- Save as draft and continue later.
- Document upload with file preview, expiry date and replacement option.
- Application status timeline: Draft, Submitted, Under Review, Changes Required, Approved, Rejected, Suspended.
- Reviewer comments displayed as specific tasks rather than a generic rejection.

Backend data and processing

- Consultant master record and versioned application records.
- Secure identity-document storage separated from public profile data.
- Document type, issuing country, expiry date, verification status and reviewer notes.
- Duplicate-account checks using email, phone and verified identity identifiers.
- Background jobs to alert before document expiry.

Business rules and validations

- Required fields vary by advisory category and jurisdiction.
- Application cannot be submitted until mandatory consent and declarations are accepted.
- Approval requires authorised Think10 reviewer action.
- A paid verification or registration fee, if introduced, must be separate from approval and clearly recorded.
- Expired mandatory identity or licence documents may automatically pause new bookings after a grace period, but final suspension requires policy logic and admin visibility.

Notifications and system actions

- Submission confirmation.
- Changes-required task with due date.
- Approval, rejection or suspension notice.
- Document expiry reminders at configurable intervals.

Permissions

- Applicant can view and edit own data only.
- Verification reviewers can view protected documents based on permission.
- Finance staff can view payout verification but not unrelated identity data.

Minimum acceptance criteria

- Applicant always sees current status and next action.
- Every file upload is virus-scanned and access-logged.
- Approval creates the correct role and does not expose protected documents publicly.

6.2. Home and daily command centre

Objective | MVP

Give the consultant a single, calm view of what must be done today.

User-facing screens and controls

- Next session card with Join button enabled only within the configured window.
- Task list for pending reports, reschedule responses, document updates and warnings.
- Seven-day availability and booking summary.
- Simple quality and earnings snapshots.
- Notification centre with severity labels.

Backend data and processing

- Aggregates booking, task, report, notification, quality and payout records.
- Caches summary metrics for fast load.
- Records card clicks for UX improvement.

Business rules and validations

- Only urgent and upcoming items appear by default.
- No more than five cards above the fold.
- Critical compliance alerts remain visible until resolved or acknowledged.

Notifications and system actions

- Upcoming call reminders.
- Overdue report notice.
- Profile or document warning.
- New payout statement.

Permissions

- Consultant sees own summary only.
- Operations may impersonate view only through audited support mode, never as the consultant.

Minimum acceptance criteria

- Home loads correctly with zero, one or many bookings.
- All totals reconcile with underlying detail pages.
- Mobile layout presents Next Consultation first.

6.3. Availability and booking management

Objective | MVP

Allow consultants to define working availability and manage legitimate schedule changes without creating customer confusion.

User-facing screens and controls

- Weekly recurring availability template.
- Date-specific time off and blocked slots.
- Timezone display and automatic conversion.
- Booking list with status filters.
- Accept/decline only where Think10 chooses a request model; otherwise confirmed bookings appear automatically.
- Reschedule request review and reason entry.
- Calendar synchronization status.

Backend data and processing

- Availability rules, exceptions and minimum notice.
- Booking lifecycle timestamps and status history.
- Calendar integration tokens stored securely.
- Conflict detection across Think10 and connected calendar.
- No-show and cancellation records.

Business rules and validations

- No double booking.
- Minimum preparation buffer and gap between sessions are configurable.
- Customer controls rescheduling where required by Think10 policy; consultant may request a change but cannot silently move the session.

- Late cancellation and no-show logic follows plan policy.
- Consultant attendance target is measured automatically.

Notifications and system actions

- New booking.
- Booking updated or cancelled.
- Reminder at configured times including one hour before.
- Calendar connection failure.
- No-show review request.

Permissions

- Consultant edits own availability.
- Operations can place administrative blocks with reason.
- Customers never see private calendar event details.

Minimum acceptance criteria

- Conflict checking works across timezones.
- Status history cannot be overwritten.
- Calendar failure does not delete Think10 booking.

6.4. Customer brief and permitted client history

Objective | MVP

Prepare the consultant using relevant business context without exposing unnecessary personal or confidential information.

User-facing screens and controls

- Customer business overview, stated problem, goals and requested outcome.
- Previous Think10 recommendations relevant to the topic.
- Uploaded documents approved for this consultant.
- Pre-call checklist and consultant private notes.
- Conflict-of-interest declaration.

Backend data and processing

- Field-level access controls for customer data.
- Document permission links tied to the booking.
- Access log for every protected file and customer record.
- AI-generated brief with sources linked to customer-provided data.

Business rules and validations

- Consultant sees only customers with an active or historical permitted relationship.
- Personal contact information is hidden unless operationally required.
- Downloads may be disabled for sensitive files.
- Conflict declaration is required before first consultation with a customer.

Notifications and system actions

- Brief ready notice.
- New customer document added.

- Access removed after retention window or dispute hold.

Permissions

- Consultant reads permitted data; cannot edit customer master data.
- Customer controls which optional documents are shared.
- Admin can revoke access immediately.

Minimum acceptance criteria

- Unauthorised consultants cannot access a customer by changing URL IDs.
- Expired booking access follows retention policy.
- Every viewed document appears in audit log.

6.5. Secure consultation workspace

Objective | MVP

Provide one screen for joining the call, reviewing context, taking notes and using AI assistance without moving to external communication channels.

User-facing screens and controls

- Pre-call device test.
- Visible recording/transcription consent status.
- Video/voice controls, screen sharing and timer.
- Customer brief panel.
- Private consultant notes.
- AI copilot suggestions clearly labelled as suggestions.
- Report/action capture panel.
- Emergency report and end-call controls.

Backend data and processing

- Video session identifiers and provider status.
- Encrypted recording reference, transcript, speaker labels and timestamps.
- Consent record for each participant.
- Call quality metrics.
- AI event stream for policy flags, topics and action items.
- Off-platform contact-sharing risk flags.

Business rules and validations

- Call recording starts only after required consent.
- AI may warn or flag suspected abuse/contact sharing; automated permanent suspension is prohibited.
- Serious safety events may pause or end the call according to approved rules.
- Consultant cannot reveal customer contact details through the interface.
- Session timer follows booked duration with configurable grace period.

Notifications and system actions

- Join reminder.
- Connection problem guidance.
- Policy warning.
- Call ended and report due notice.

Permissions

- Consultant and booked customer join the session.
- QC staff access recordings only for authorised review.
- Support may troubleshoot technical metadata without opening content unless permitted.

Minimum acceptance criteria

- Consent is recorded before recording.
- Reconnect does not create duplicate booking completion.
- Call failure creates support case and preserves evidence.
- AI flags are clearly marked as unconfirmed until reviewed.

6.6. Consultation report and action plan

Objective | MVP

Turn every call into a useful, structured and traceable business output.

User-facing screens and controls

- AI-generated draft summary.
- Editable sections: issue, context, diagnosis, recommendations, risks, actions, owners, deadlines, follow-up.
- Confidence or evidence flags.
- Attach approved templates or files.
- Preview customer version.
- Approve and submit.

Backend data and processing

- Versioned report records.
- Links to booking, transcript segments and referenced files.
- Action-item status and due dates.
- Consultant approval timestamp.
- Customer acknowledgement and follow-up status.

Business rules and validations

- Consultant remains responsible for final advice and must approve before release.
- Restricted professional advice requires appropriate advisor category or disclaimer.
- Editing after customer delivery creates a new version and visible amendment note.
- Report due-time target is configurable and measured.

Notifications and system actions

- Draft ready.
- Report deadline approaching.
- Report delivered.
- Customer comment or clarification request.

Permissions

- Consultant edits own assigned reports.
- Customer views delivered version and may comment.
- QC can review and request correction without silently editing consultant advice.

Minimum acceptance criteria

- Customer receives a readable report even when no transcript exists.
- All versions remain recoverable.
- Action items appear in customer dashboard immediately after release.

6.7. Performance, quality and learning

Objective | MVP

Help consultants understand the standards, recognise strengths and correct issues before enforcement is required.

User-facing screens and controls

- Advisor Quality Score with component breakdown.
- Attendance, punctuality, rating, repeat booking, report timeliness and complaint metrics.
- Customer reviews with moderation status.
- Warnings, improvement plans and appeal button.
- Required training and policy acknowledgements.
- Achievement badges only where meaningful.

Backend data and processing

- Metric snapshots by period.
- Weighted score calculation and confidence based on sample size.
- AI quality reviews and human QC reviews stored separately.
- Warning, suspension and appeal case records.
- Training completion records.

Business rules and validations

- Star rating alone does not automatically suspend a consultant.
- Thresholds consider minimum completed sessions and severity.
- Target attendance may be 95%, but approved exceptions are excluded.
- Quality score methodology is versioned and visible.
- Permanent removal requires authorised human decision.

Notifications and system actions

- New review.
- Performance warning.
- Improvement plan due.
- Training assigned.
- Appeal outcome.

Permissions

- Consultant sees own detailed metrics.
- Public profile sees only approved public rating data.
- QC sees evidence and can create cases.
- Finance cannot change quality outcomes.

Minimum acceptance criteria

- Metrics reconcile to source records.

- Warnings show reason, evidence, policy and appeal path.
- A consultant with few reviews is not treated as statistically equivalent to one with many reviews.

6.8. Earnings, commission and payouts

Objective | MVP

Give consultants a transparent record of what they earned, what Think10 deducted, what is on hold and when payment will arrive.

User-facing screens and controls

- Earnings summary by current and previous periods.
- Per-consultation breakdown.
- Commission, tax or fee lines.
- Pending, eligible, processing, paid, failed and held statuses.
- Payout schedule and bank-account status.
- Downloadable statement and invoice/supporting-document area.

Backend data and processing

- Ledger entries rather than editable totals.
- Payout batch, payment-provider reference and reconciliation status.
- Refund, dispute and quality-hold links.
- Bank details token/reference rather than plain display.

Business rules and validations

- Consultants are paid according to the approved cycle, proposed every 15 days.
- Only successfully completed and eligible calls enter payout.
- Refunds, disputes or fraud cases may place specific items on hold, not the entire account without reason.
- Bank-detail changes trigger verification and cooling-off controls.

Notifications and system actions

- Payout eligibility notice.
- Payout sent or failed.
- Bank verification required.
- Item placed on hold with reason.

Permissions

- Consultant views own ledger.
- Finance creates and releases payout batches.
- Operations views status but cannot alter ledger values directly.

Minimum acceptance criteria

- Every displayed total equals ledger sum.
- Failed payouts can be retried without duplicate payment.
- Sensitive bank data is masked.

6.9. Public profile, credentials and marketing

Objective | MVP profile; marketing in Phase 2

Allow consultants to maintain an accurate, trusted and useful profile while Think10 controls approval, claims and sponsored visibility.

User-facing screens and controls

- Profile photo, headline, biography, expertise, industries, languages, experience, consultation topics and portfolio.
- Profile completeness meter.
- Preview public profile.
- Submit changes for review where required.
- Optional referral link and promoted-profile request as later-phase features.

Backend data and processing

- Public profile version and approval status.
- Claims/evidence mapping.
- Search tags and matching attributes.
- Profile view, conversion and booking analytics.
- Referral attribution.

Business rules and validations

- Mandatory profile completeness should be clearly defined; warning and suspension thresholds must not hide completed bookings or payouts.
- Restricted claims require evidence.
- Personal phone, email, social links and external booking links are blocked or reviewed.
- Sponsored placement is labelled and does not replace relevance/quality controls.

Notifications and system actions

- Profile change approved/rejected.
- Completeness warning.
- Document or claim expiry.
- Marketing campaign status.

Permissions

- Consultant edits own profile.
- Profile reviewers approve regulated or high-risk fields.
- Marketing staff manage sponsored inventory but cannot change quality score.

Minimum acceptance criteria

- Public and private data never mix.
- Blocked contact information is detected on text and uploaded content.
- Profile changes are versioned.

6.10. Help, support, disputes and settings

Objective | MVP

Make it easy to solve technical, booking, payment, quality and policy issues without sharing information outside the platform.

User-facing screens and controls

- Searchable help centre.
- Create support ticket with category and booking reference.
- Live chat or callback request when available.
- Dispute/appeal form.
- Notification preferences, timezone, language, security and device sessions.
- Download agreements and policies.

Backend data and processing

- Ticket records, SLA, owner, priority and conversation history.
- Links to relevant booking/payment/quality records.
- Security session and device log.
- Notification preference records.

Business rules and validations

- Sensitive disputes use restricted queues.
- Support staff cannot request passwords or full bank information.
- Account closure follows retention and payout rules.
- Critical notices cannot be disabled.

Notifications and system actions

- Ticket updates.
- SLA escalation.
- Security alert.
- Policy change requiring acknowledgement.

Permissions

- Consultant sees own cases.
- Support access depends on queue and sensitivity.
- Security administrators manage sessions without reading consultation content.

Minimum acceptance criteria

- Ticket status and owner are always visible.
- Evidence attachments are protected.
- Closing an account does not erase records that must be retained.

7. KPI definitions

KPI	Definition	Use
Attendance rate	Attended eligible sessions / eligible confirmed sessions.	Reliability; approved exceptions excluded.

KPI	Definition	Use
On-time rate	Sessions joined within the permitted window / attended sessions.	Customer experience.
Average customer rating	Weighted rating with minimum-sample handling.	Satisfaction indicator, not sole enforcement metric.
Repeat booking rate	Customers booking the same consultant again / customers served.	Trust and value.
Report on-time rate	Reports approved within target / completed sessions.	Operational discipline.
Complaint rate	Validated complaints / completed sessions.	Risk and quality.
Advisor Quality Score	Weighted combination of quality metrics and QC evidence.	Ranking, coaching and eligibility.
Profile completeness	Approved required profile items completed / required items.	Discoverability and compliance.
Consultation conversion	Profile viewers who create a paid booking.	Profile effectiveness.

8. Consultant permission matrix

Function	Applicant	Approved	Suspended	Think10 QC	Finance
Edit application/profile	Yes	Yes	Limited	Review	No
Set availability	No	Yes	No	View	No
Join consultation	No	Yes	No	Review only	No
View protected client brief	No	Assigned only	Historical limited	Case-based	No
Approve report	No	Assigned only	No	Request correction	No
View payout data	No	Own only	Own only	Status only	Full operational
Change quality outcome	No	No	No	Authorised only	No

9. Event and notification catalogue

Event	Channel	Timing	Required content
New booking	In-app + email; optional SMS/push	Immediately	Date, time, topic, preparation link.
Call reminder	In-app + email/push	Configurable; includes 1 hour before	Join link, device test, reschedule policy.
Report due	In-app + email	After call and before deadline	Booking, deadline, open draft.
Quality warning	In-app + email	After authorised issue	Metric/evidence, required action, appeal path.
Document expiry	In-app + email	Configured intervals	Document, expiry date, replacement link.
Payout processed	In-app + email	When status changes	Amount, period, reference, expected settlement.
Security alert	Email + in-app	Immediately	Device/location information and secure account link.

10. Recommended integrations

Capability	Integration type	Important requirement
Video/voice calls	Embedded conferencing provider or WebRTC service	Consent, recording control, quality metrics, secure tokens.
Calendar	Google/Microsoft calendar APIs	Free/busy sync without exposing private event details.
Email/SMS/push	Notification providers	Template versioning, delivery logs and opt-out rules.
Payments/payouts	Licensed marketplace payment provider	Ledger, split settlement or payout workflow, reconciliation.
Identity verification	KYC/identity provider where appropriate	Secure document handling and manual fallback.
AI/transcription	Model router + speech-to-text + policy analysis	Vendor-independent logs, confidence, cost and data controls.
File storage	Encrypted object storage	Signed URLs, antivirus scanning and retention policies.

11. MVP build priority

Priority	Build now	Build later
P0 - Required to launch	Application, verification, profile, availability, bookings, call room, reports, earnings basics, quality basics, support.	None.
P1 - Stabilise	Calendar sync, advanced QC workflows, appeals, payout reconciliation, training.	Profile ads and referrals.
P2 - Growth	Profile analytics, referrals, sponsored placement, advanced AI coaching.	Gamification and broad social features.

Shared platform assumptions

- **Responsive design:** All dashboards must work on desktop, tablet and mobile. High-complexity admin tables may use horizontal scrolling on smaller screens.
- **Role-based access:** Every page, button, record and export is controlled by user role and permission.
- **Single sign-on and security:** Email/phone verification, strong passwords, optional multi-factor authentication, session timeout and suspicious-login alerts.
- **Consent first:** Recording, transcription, AI analysis and document processing require visible consent and audit records.
- **One source of truth:** Customer, consultant, booking, payment, report and quality data must be stored as linked records rather than copied into disconnected tools.
- **Human review:** AI can flag and recommend, but high-impact decisions such as permanent suspension, payment withholding and dispute outcomes require authorised human approval.
- **Auditability:** Every important change records who changed it, what changed, when it changed and the previous value.
- **Simple experience:** Each dashboard should show only the actions relevant to that stakeholder. Advanced controls are hidden under More, Filters or Settings.

Non-functional requirements

Area	Requirement
------	-------------

Area	Requirement
Performance	Home page loads within 3 seconds under normal operating conditions; common actions provide visible feedback within 1 second.
Availability	Target 99.5% platform availability at launch, excluding planned maintenance.
Security	Encryption in transit and at rest; least-privilege access; secrets stored outside application code; periodic penetration testing.
Privacy	Configurable data-retention rules; controlled access to identity documents, bank details, recordings and transcripts.
Accessibility	Keyboard navigation, readable contrast, labelled form fields, screen-reader-friendly structure and captions/transcripts for recorded content.
Scalability	Services should support growth in users, calls, AI conversations and documents without redesigning the core data model.
Observability	Application logs, error logs, integration status, job queues, AI latency/cost, payment failures and call failures are monitored.
Backup and recovery	Automated backups, tested recovery procedures and defined recovery objectives.
Localization	Architecture should support English first and later Arabic and other languages, including right-to-left layout.
Consultation continuity	A dropped connection must allow re-entry and preserve notes, elapsed time and consent state.

Glossary for developers

Term	Meaning
Zyne VA	Free Virtual Assistant used for platform guidance, lead qualification and plan conversion.
Zyne VC	Paid Virtual Consultant used for business diagnosis, recommendations, reports and action plans.
Credit	A unit used to book a defined duration or type of human consultation.
Booking	A scheduled consultation between one customer and one consultant.
Consultation workspace	The secure screen containing the customer brief, call controls, notes, AI support and report tools.
Action Plan	A structured post-consultation record containing decisions, tasks, owners, deadlines and follow-up.
Quality flag	An AI or human-created alert for attendance, conduct, policy, advice quality or confidentiality concerns.
Advisor Quality Score	Combined score using ratings, attendance, complaints, repeat bookings, AI review and human QC.
Business Profile	The customer's structured business information, goals, stage, markets, channels and history.
Business Health Score	A diagnostic score across Think10 business dimensions.
RBAC	Role-based access control: permissions based on a person's assigned role.
Audit log	A permanent history of significant system actions and data changes.
